Explanation

This is a Descriptive Analysis of the English Premier League, and the teams competing in it. Specifically, the state of the attack put forth by the teams in the English top flight. I visualized which teams attempt more attacks (Intent), and their effectiveness on goal. Set pieces (corners, throw ins, and free kicks) have been prominent in the conversation about the Premier League. They are an important avenue of attack for teams this year so I looked at their volume and the effectiveness of each team executing the set pieces they receive. There have been a few remarkable attackers across Europe this season namely Erling Haaland, Kylian Mbappe, and Harry Kane. Haaland of course plays in the premier league so it is interesting to compare his output to that of his domestic counterparts. Additionally, a team's attacking tendencies and style of play will reveal themselves in its most prolific players on goal so, I include an analysis of individual players shots and their effectiveness.

Transformations

To make sure the team's name can be used a key across tables I changed the column name to team in every table, I also standardized all the team names to a singular version Man city-> Manchester City, Newcastle-> Newcastle United etc.
I dropped a column of null values in the pressing table
I renamed many columns to clarify their meaning xg-> Expected goals, Fast Break->Counter.
I calculated the passes by a team in their opponents final third as a percentage of all their passes this new column is in the field tilt visualization this value expresses how much a team manages to put pressure on their opponent and create a threat near their goal. Additionally, I calculated the percentage of goals per 90 scored by a team relative to goals scored in total during their games this metric shows attacking effectiveness as well as good defensive structure.

Interactive Features

The interactive feature I implemented was the bookmark bar at the top right corner. It improves the dashboard by allowing the viewer to flip through the visualizations which are grouped together by a common theme.
